

Helping to build a better America

Remember this figure: 900 million dollars. It's a lot of money—but it's more than just money. It is an expression of confidence and cooperation.

United States Steel is putting more than 900 million dollars into plant improvements and additions to provide the steel that America needs. This great postwar construction program started out as a half-billion dollar project. It's nearly double that now. And better than two-thirds of the program has been completed.

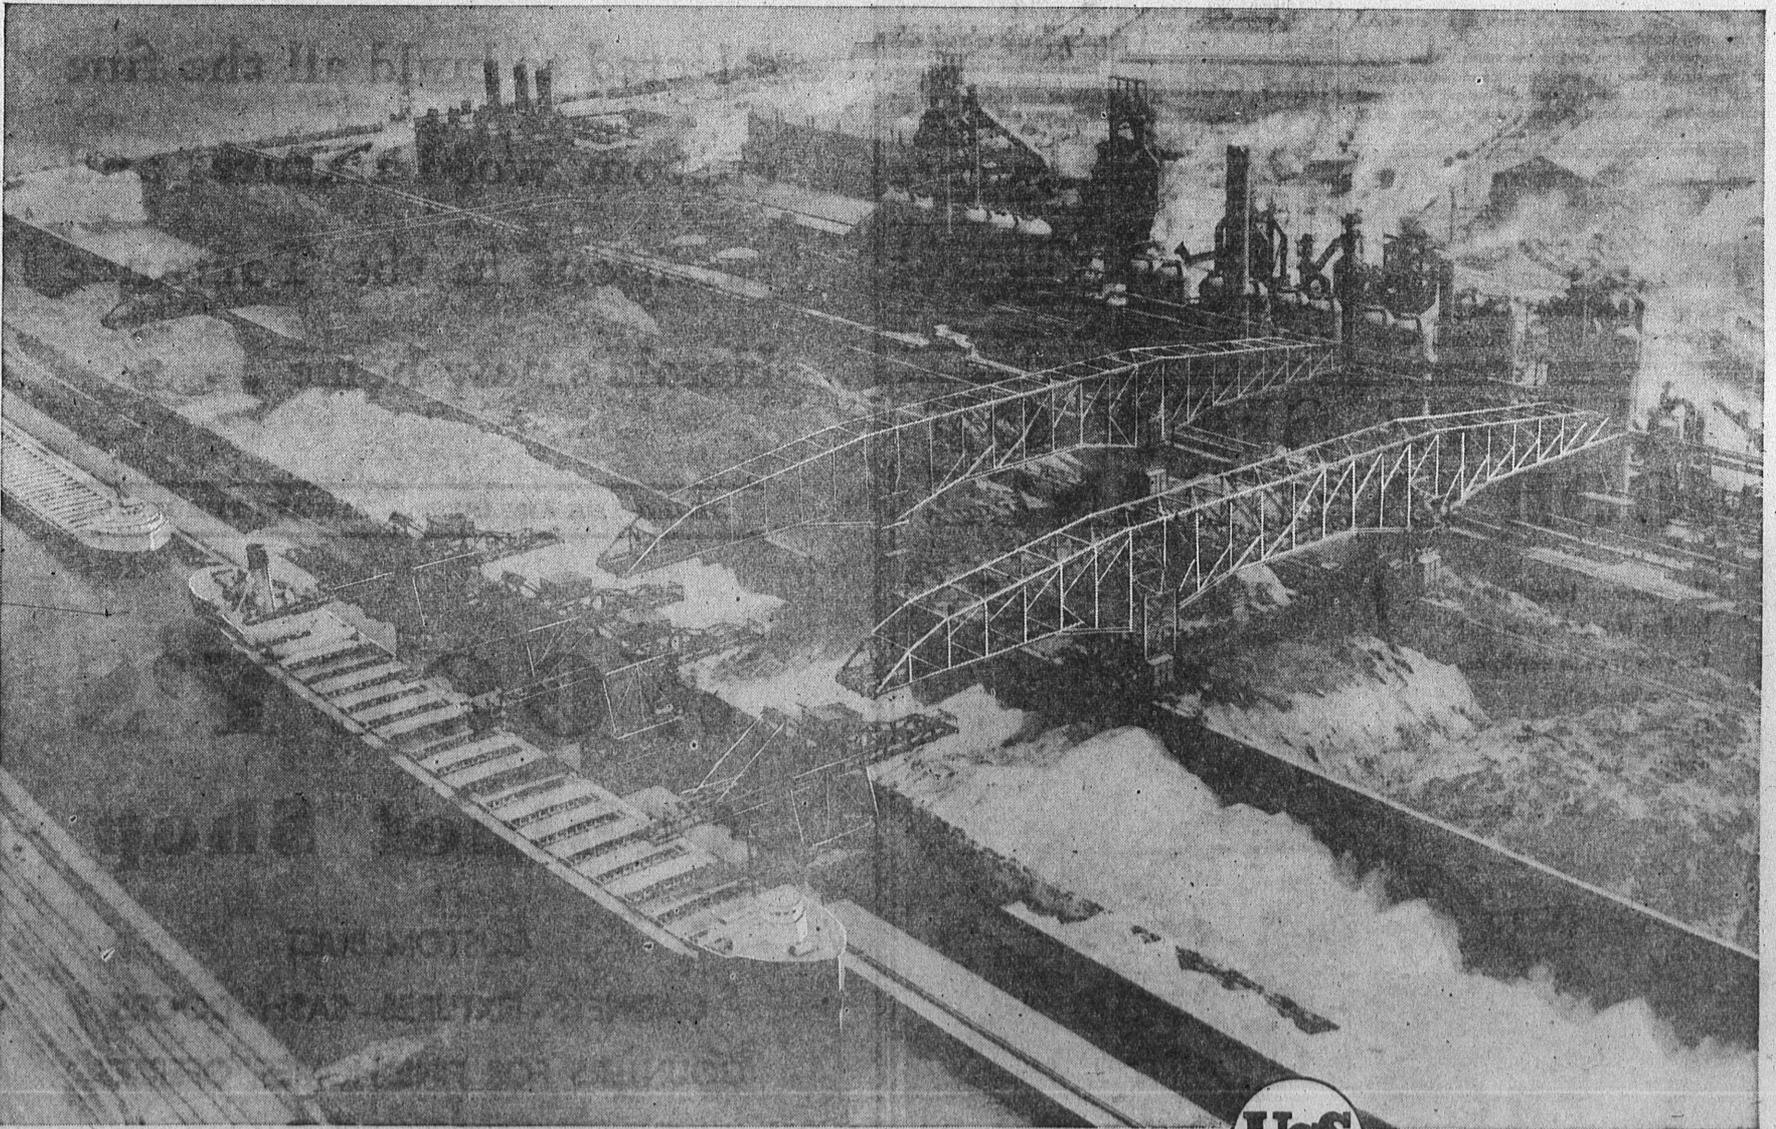

Meanwhile, the plants of United States Steel are running at capacity, breaking peacetime production records. Never before has there been so much constructive demand for steel. Housing... automobiles... new highways... badly needed railroad equipment... bridges... power projects... new oil wells and refineries and gas

lines... sewage disposal plants and other community improvements... all these are calling for steel, steel, and more steel. Never forgetting, of course, the steel for national defense.

Those are a few of the places where U. S. Steel products are going.

An important part of this job has been the development of new and better steels by U. S. Steel research laboratories. Another current U. S. Steel program, involving both research and conservation and requiring an expenditure of 34 million dollars, is aimed at improving the use of iron ores and conserving America's natural resources.

United States Steel is helping to build a better America—and getting ready to supply the greater quantity of steel that will be needed tomorrow.
