### A MESSAGE FROM DUNCAN HINES

"Have you hesitated to try a cake mix—because you are doubtful about the quality of 'cake mix' cakes? Or have you used cake mixes with disappointing results?"

"I know how you feel. I long sensed the need for a cake mix that would give you the unforgettable goodness of home-made 'recipe' cakes. So I decided to take action."

"The result is my new Duncan Hines Cake Mixes. I am proud of them—and I know you will share my enthusiasm. Try them at Market Town this week-end."

### Walteria Lake Drain Planning Started by City

Preparation of preliminary plans for the Walteria Lake area drainage system have been started by the city, it was revealed yesterday by John R. Patrick, assistant to the city engineer.

The Walteria Lake drain will tie in with the Lomita Blvd. storm drain, plans for which are expected to be completed next week by the county engineer's office.

The drains are part of the \$178,000,000 bond issue approved by voters of the flood control district last November.

Final drawings on the Lomita Blvd. storm drain, estimated to cost about \$965,900 are expected to be approved by the district flood control office this fall and a call for bids made in time to start construction sometime in October or November.

Johns Harbor City  
The Lomita Blvd. drain will tie in with the existing Harbor City drain which now empties into Bixby Slough. Plans are also nearing completion for a drain from the slough to the West Basin in the Harbor.

### Formula For Judging Car Speed Given

How good are you at judging the speed of an automobile? The chances are you won't do so well unless you have had experience and training, says B. R. Caldwell, Commissioner of the California Highway Patrol.

"Far too many people get in trouble on the highway because they don't realize how fast they are traveling," Caldwell said. "Consequently they find they haven't space or time to escape disaster."

"An easy way to tell how much ground a car covers in one second is to take the speed shown on the speedometer and multiply that figure by one and one-half, or just add one half the figure to itself. Either way it comes out almost mathematically correct. For instance, a car traveling 40 miles an hour goes 60 feet in one second. At 55 miles an hour it goes 77.5 feet and a car traveling that fast requires 287 feet in which to stop. Also at 55 miles per hour the chances of someone being killed in case of accident are 1 in 12. At 65 miles per hour the chances are 1 in 6.

"Smart motorists learn these facts about speed and stay out of trouble. They know that trying to save a few minutes may sometimes lead to disaster."
